Clay Minerals as Climate Change Indicators A Case Study

The clay-mineral distributions of modern continental soils show the main controls of climate change rather than changes in the lithology (Chamley, 1989; Xiong, 1986). Thus, compared to other proxies, clay-mineral assemblages are relatively less influenced by provenance changes.

Clay Minerals as Climate Change Indicators—A Case Study - CORE A clay samples were treated with ethylene glycol and subsequently analyzed. It was evident by this group of minerals that the main source of information about past climate change in the given region comes from illite-smectite and illite composition. The more vivid climate signal within the mineralogical historical records is the ...

The Intergovernmental Panel on Climate Change (IPCC) produced five reports since 1990, and unfortunately each new one found that what had been considered the worst case scenario in the previous had by then actually happened. If we now look at the worst case scenario of the latest report – that if we do not take very strong actions now, good luck to our children and grandchildren – do we ...

Climate Change: climate-change: Clay minerals call the shots with carbon. October 21, 2019 . Source: Science Daily. Clay minerals suspended in seawater binds sedimentary organic carbon to their mineral surfaces. But the quantity of carbon that is bound and the source of that carbon very much depends on the clay mineral in question. A research team has shown this by studying sediments in the ...
